The Dairy Brain monthly meeting was held on Friday April 19th.

The core of our monthly meeting was about the discussion of the fine-tuning the Net Present Value tool implementation for real-time functioning and access to final users.

We still don’t have any updates on the USDA/NIFA grant proposal.

Results from the Dairy Brain were presented on the poster session on the University Industry Consortium meeting, held on the Wisconsin Institute of Discovery (WID) at UW-Madison on April 16th.

- Implementing a better nutritional grouping strategy in commercial dairy farms.
- The use of genomic traits and management integrated data to identify first lactation cows in risk of clinical mastitis using machine learning algorithms.
- Early prediction of clinical mastitis using machine learning algorithms.
